BIO	I am an applied microeconomist. I specialize in designing identification strategies in complex settings, such as using within-student/within-teacher comparisons or exploiting specific program features (like a bonus cap) to build valid counterfactuals. I also focus on the contextual inferential challenges; for example, my BMI paper suggests a finite-sample correction that improves test size for inference in single treated cluster settings with limited pre-period data. My interests are also drawn to political economy, specifically voting behavior and partisan alignment in the US.
